MCKINSEY GLOBAL INSTITUTE

Since its founding in 1990, the McKinsey Global Institute (MGI) has sought to develop a deeper understanding of the evolving global economy. As the business and economics research arm of McKinsey & Company, MGI aims to provide leaders in the commercial, public, and social sectors with the facts and insights on which to base management and policy decisions. The Lauder Institute at the University of Pennsylvania has ranked MGI the world's number-one private-sector think tank in its Think Tank Index.

MGI research combines the disciplines of economics and management, employing the analytical tools of economics with the insights of business leaders. Our “micro-to-macro” methodology examines microeconomic industry trends to better understand the broad macroeconomic forces affecting business strategy and public policy. MGI's in-depth reports have covered more than 20 countries and 30 industries. Current research focuses on six themes: productivity and growth, natural resources, labor markets, the evolution of global financial markets, the economic impact of technology and innovation, and urbanization. Recent reports have assessed the digital economy, impact of AI and automation on employment, income inequality, the productivity puzzle, the economic benefits of tackling gender inequality, a new era of global competition, Chinese innovation, and digital and financial globalization.

MGI is led by three McKinsey & Company senior partners: Jacques Bughin, Jonathan Woetzel, and James Manyika, who also serves as the chairman of MGI. Michael Chui, Susan Lund, Anu Madgavkar, Sree Ramaswamy, and Jaana Remes are MGI partners, and Jan Mischke and Jeongmin Seong are MGI senior fellows.

Project teams are led by the MGI partners and a group of senior fellows, and include consultants from McKinsey offices around the world. These teams draw on McKinsey's global network of partners and industry and management experts. Advice and input to MGI research are provided by the MGI Council, members of which are also involved in MGI's research. MGI council members are drawn from around the world and from various sectors and include Andrés Cadena, Sandrine Devillard, Richard Dobbs, Katy George, Rajat Gupta, Eric Hazan, Eric Labaye, Acha Leke, Frank Mattern, Scott Nyquist, Gary Pinkus, Sven Smit, Oliver Tonby, and Eckart Windhagen. In addition, leading economists, including Nobel laureates, act as research advisers to MGI research.

The partners of McKinsey fund MGI's research; it is not commissioned by any business, government, or other institution. For further information about MGI and to download reports, please visit www.mckinsey.com/mgi.

BRIDGING INFRASTRUCTURE GAPS: HAS THE WORLD MADE PROGRESS?

Today, the world invests nearly 14 percent of global GDP in infrastructure and real estate. Ailing infrastructure assets, rising populations, and the demands of economic development are driving countries' desire to channel more funding into transport, power, and other systems that catalyze recovery and growth.

In 2013, McKinsey Global Institute research found that the trajectory of spending would leave countries facing major gaps in infrastructure. Despite a recent rise in investment in economic infrastructure, gaps remain.

The world spent \$9.5 trillion—14 percent of global GDP—on infrastructure in 2015

Infrastructure-related spending (using the broadest definition that includes real estate, oil and gas, and mining) totaled \$9.5 trillion in 2015, or 14 percent of global GDP. Real estate, social infrastructure, and transport accounted for the bulk of spending (Exhibit 1).

Exhibit 1

Infrastructure spending by asset class, 2015¹

Nominal investment in infrastructure, 2015
\$ billion

■ Economic infrastructure ■ Broader definition of infrastructure ■ Real estate

1 The World Bank's definition of infrastructure includes utilities (gas and electricity, water supply, telecommunications, sewerage, and waste collection and disposal), public works (roads and major dam and canal works for irrigation and drainage), and other transport sectors (railways, ports, waterways, and airports); OECD includes public works in a country, state or region, including roads, utility lines, and public buildings.

2 Lower water capex due to changes in the exact category definitions applied and updates to estimates by Global Water Intelligence.

NOTE: Numbers may not sum due to rounding.

SOURCE: IHS; Euroconstruct; IMF; World Bank; OECD; McKinsey Global Institute analysis

Using the same broad definition, China was the world's largest infrastructure market in 2015 with 38 percent of global spending, followed by North America (21 percent) and Western Europe (17 percent). Over the past five years, the fastest-growing markets for infrastructure spending have been India with compound annual growth in real terms of 10 percent, China (7 percent), and North America (3 percent).

It's not enough: \$3.7 trillion a year of investment in economic infrastructure needed to 2035

Looking more closely at the network infrastructure necessary to support economies—roads, railways, ports, airports, power, water, and telecoms—the world needs to invest an average of \$3.7 trillion in these assets every year through 2035 in order to keep pace with projected GDP growth (Exhibit 2). This need could increase further by up to \$1 trillion annually in order to meet the United Nations' sustainable development goals.

Exhibit 2

Average annual need, 2017–35

\$ trillion, constant 2017 dollars

Annual spending % of GDP	1.0	0.4	0.1	0.1	1.3	0.5	0.6	4.1
Aggregate spending, 2017–35 \$ trillion	18.0	7.9	1.6	2.1	20.2	9.1	10.4	69.4

NOTE: Numbers may not sum due to rounding.

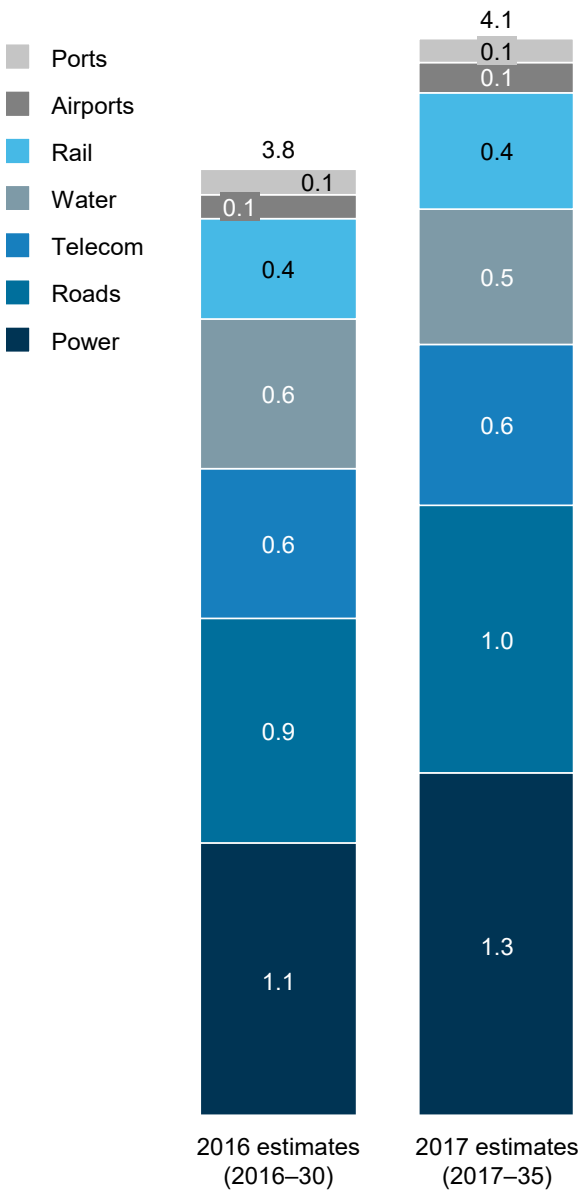

SOURCE: IHS Global Insight; ITF; GWI, National Statistics; McKinsey Global Institute analysis

The overall spend estimate has risen from \$3.3 trillion to \$3.7 trillion annually since our 2016 projection or \$69.4 trillion total to 2035 due to an improved GDP growth outlook and a number of technical improvements (Exhibit 3).

Exhibit 3

Aggregate infrastructure spending

By sector
% of GDP

By region

%, \$ trillion, constant dollars

1 Projections now cover 19 years (2017–35) instead of 15 years (2016–30): We changed our projection period end from 2030, as used in our 2013 and 2016 reports, to 2035 to maintain a sufficiently long projection period; as a consequence, numbers are comparable to prior estimates only in percent of GDP terms. Data is based on latest infrastructure stock data of 2015 instead of 2012; base-year prices have been updated to 2017 instead of 2015; GDP-growth projections have increased, driving higher infrastructure needs; improved data and projections by external providers of water and telecom data.
NOTE: Numbers may not sum due to rounding.

SOURCE: IHS Global Insight; ITF; GWI, National Statistics; McKinsey Global Institute analysis

Fifty-four percent of the world's need will be in Asia, the bulk of this in the world's two fastest-growing and most populous countries. China will account for 34 percent of global need and India 8 percent. Investment will continue to shift to emerging markets; nearly two-thirds of global infrastructure investment in the period to 2035 is required in emerging economies (Exhibit 4).

A number of technological disruptions will further shape those needs in ways we cannot yet predict, like the electrification of transport infrastructure, the move to autonomous vehicles including drones, or digitization impacting logistics and value chains.

Exhibit 4

Investment needs—economic infrastructure

%, \$ trillion (at constant 2017 prices)

NOTE: Numbers may not sum due to rounding.

SOURCE: IHS Global Insight; ITF; GWI, National Statistics; McKinsey Global Institute analysis

There is a \$5.5 trillion spending gap globally between now and 2035, with regional variations

The world's infrastructure investment has fallen short of investment needs, but the size of the gap varies considerably among geographies (Exhibit 5).

Exhibit 5

The infrastructure spending gap varies widely among geographies

Economic infrastructure
% of GDP

1 The global gap for 2017–35 as a share of GDP is calculated by adding negative values, converting to dollar terms, then dividing by cumulative world GDP. Without adjusting for positive gap, the value is 0.10%. This has been calculated from a set of 48 countries for which data are available for all sectors. This gap does not include additional investments needed to meet the UN Sustainable Development Goals.
NOTE: Not to scale.

SOURCE: IHS Global Insight; ITF; GWI, National Statistics; McKinsey Global Institute analysis

Australia, China, and Japan, for instance, have invested sufficiently to exceed their forecast infrastructure requirement, and will arguably need to spend less as a share of GDP than they have in the past. In contrast, countries including Germany, the United Kingdom, and the United States have significant gaps between their current spending commitments and estimated need. Reflecting the fact that the majority of demand for infrastructure is in emerging economies, some of the biggest spending gaps are in Brazil, Indonesia, and Mexico.

Unless these countries unlock new funding and increase their spending, they will feel the impact of underinvestment most acutely.

Affordable housing issues exacerbate the gaps in economic infrastructure. As urban populations expand, current trends suggest that there could be 106 million more low-income urban households by 2025. Replacing today's inadequate housing and building the additional units needed would require up to \$16 trillion in spending, including the costs of land and construction. Of this, up to \$3 trillion may have to come from public funding.

There appears to be progress in stepping up infrastructure investment

While a sharp decline in mining and oil and gas investment reduced overall construction-related spending, investment in economic infrastructure rose from 2013 to 2015, most notably in utilities.

Many G20 countries that cut back their spending on infrastructure during and after the global financial crisis seem to have realized that there is an investment imperative, and started to act on it (Exhibit 6). For example, member states of the European Union, in aggregate, raised their investment by 10 percent over this period in absolute terms, notably reflecting higher spending in Germany and Italy. Among emerging economies, India, Indonesia, and South Africa have all raised their investment rates.

However, the United States is yet to match the level of investment that prevailed before the financial crisis, and countries including Australia and China have cut their investment relative to GDP—arguably a step in the right direction for their economies.

Exhibit 6

Change in infrastructure investment rate

Percentage points of country or region's GDP

■ Decreased ■ Increased

2 Data includes only power, water, and telecom sectors.

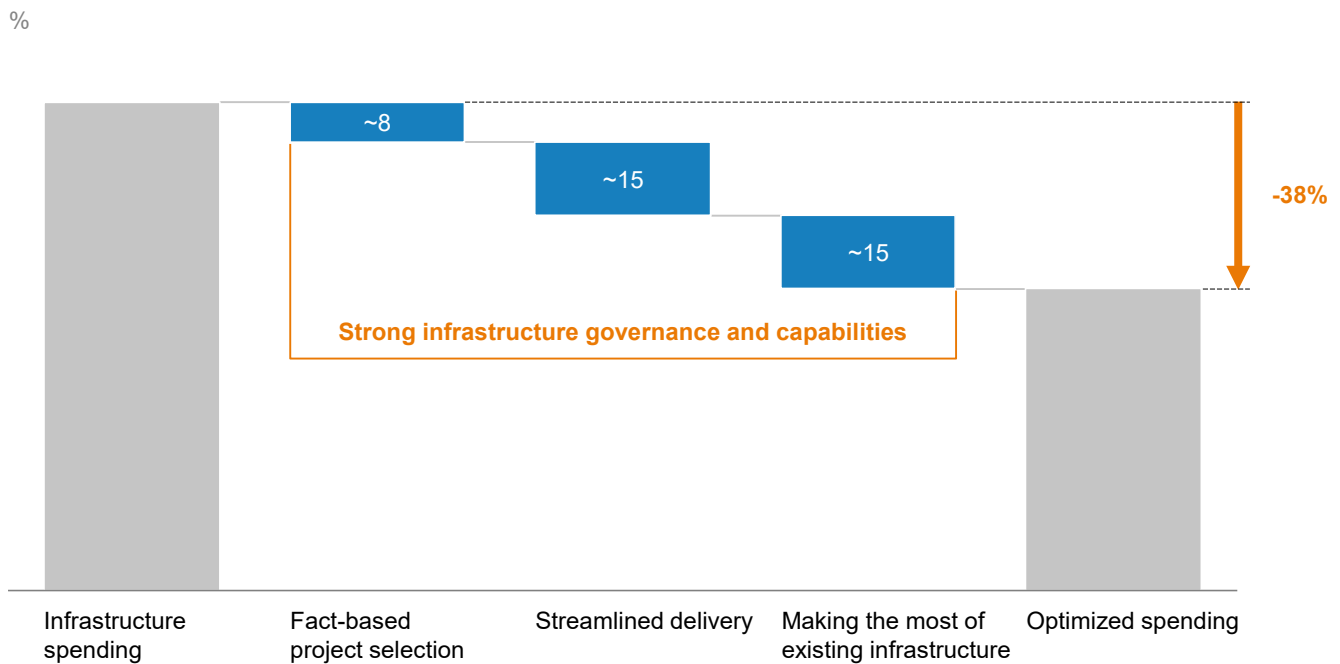

SOURCE: IHS Global Insight; ITF; GWI, National Statistics; McKinsey Global Institute analysis

Efficient and effective investment is critical for closing the infrastructure gap

There is significant room to improve the effectiveness and efficiency of how infrastructure investment is spent. Up to 38 percent of global infrastructure investment is not spent effectively because of bottlenecks, lack of innovation, and market failures. Fact-based project selection, streamlined delivery, and the optimization of operations and maintenance of existing infrastructure can close this gap, reducing spending by more than \$1 trillion a year for the same amount of infrastructure delivered (Exhibit 7).

Exhibit 7

Closing the gap will not be easy—but it is possible

SOURCE: McKinsey Global Institute analysis

Closing the infrastructure investment gap will not be easy—but it is both necessary and possible. Our 2016 report, *Bridging global infrastructure gaps*, examines how public- and private-sector players can ramp up spending while also making better use of investment. Improving productivity in the construction sector alone could unleash an additional \$1.6 trillion in value. Leaders of the Global Infrastructure Initiative community are engaged in a continuing conversation about searching for new financing streams for infrastructure and capital projects.

There has been strong recognition of the urgent investment need for many years—but being aware of the problem is not enough. There need to be national and collective global efforts to channel abundant liquidity into much-needed infrastructure. Countries that fail to act today could be placing future growth, economic development, and productivity on the line.
